

Adaptive distributed systems with AOP

Sara Bouchenak
Associate Professor, University of Grenoble, France
Sara.Bouchenak@imag.fr
<http://membres-liglab.imag.fr/bouchenak/teaching/>

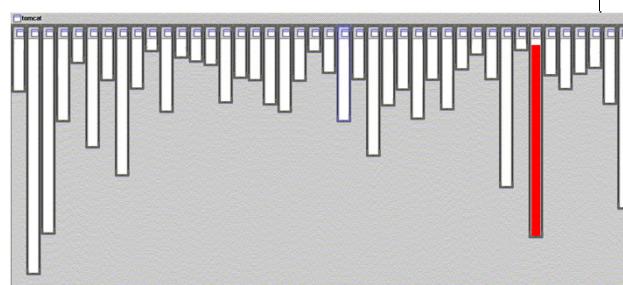

Agenda

Lecture, Monday, 14:00 – 17:00	Lab, Monday, 14:00 – 17:00
Introduction to adaptive computing systems	Java Management eXtensions – JMX
AOP-based adaptive systems	Introduction to AspectJ
Interruption week	
Non-functional aspects of computing systems (logging, security, dependability, etc.)	Logging with AspectJ
Autonomic computing (case studies)	Security with AspectJ
Self-adaptive systems (case studies)	Dependability with AspectJ
Interruption week	
Summary and future directions	Evaluation

2

Good Modularity

XML Parsing

- Parsing XML in org.apache.tomcat
 - red shows the code we are interested in
 - all the code is in one module (class) ☺

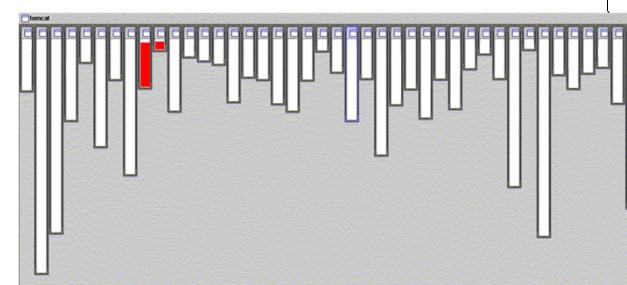

© S. Bouchenak

Adaptive Computing Systems

3

Good Modularity

URL Pattern Recognition

- URL pattern recognition in org.apache.tomcat
 - the code we are interested in is in two classes ☺

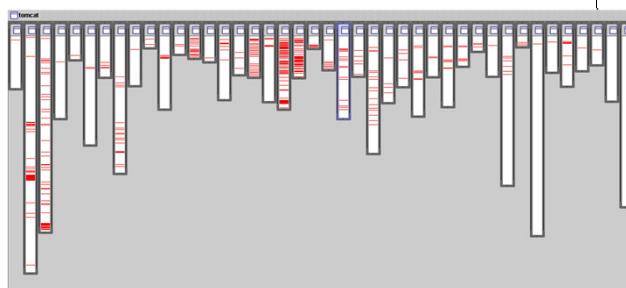

© S. Bouchenak

Adaptive Computing Systems

4

Problems

Tracing: Non-Modular

- Tracing in org.apache.tomcat
 - red lines
 - are not in one module
 - are almost everywhere 😊

© S. Bouchenak

Adaptive Computing Systems

5

Problems

Session Termination: Non-Modular

ApplicationSession StandardSession

SessionInterceptor

StandardManager

StandardSessionManager

ServerSession

ServerSessionManager

© S. Bouchenak

Adaptive Computing Systems

6

Conclusion about the code

org.apache.tomcat

- Localized processing
 - Configuration files, XML parsing
- Processing implemented with few classes
 - HTTP requests, regular expressions
- Processing scattered everywhere
 - tracing, analysis of problems, account of encountered problems during request processing

© S. Bouchenak

Adaptive Computing Systems

7

What are the problems with non-modular code?

- Redundancy
 - Same processing repeated throughout the application code
- Obscure code
 - Code structure is not explicit
 - Global code architecture difficult to understand
- Difficult to change/maintain code
 - Need to find fragments that concern the feature we want to change
 - Need to make sure that changes are consistent i.e that a change in one place does not "hurt" a change in another place
 - Very few tools to help...

© S. Bouchenak

Adaptive Computing Systems

8

AOP Principles

- Separate tangled code
- Minimize inter-code dependancies
- All processings should have
 - a clear objective
 - a well-defined modular structure
- Aspects
 - Modular processings that can be “mixed”/composed/tangled/organized together

© S. Bouchenak

Adaptive Computing Systems

9

Outline

1. Introduction to AOP
2. Introduction to AspectJ
3. Syntax of AspectJ
4. Software Development with AspectJ
5. Conclusion and References

© S. Bouchenak

Adaptive Computing Systems

10

AOP Definition

- AOP = Aspect-Oriented Programming
- "Aspect-oriented programming allows the factorization of processings whose implementation is scattered through a system"

© S. Bouchenak

Adaptive Computing Systems

11

Types of Aspects

- A software system comprises:
 - Application aspects that correspond to **core concerns**. These are the software modules that implement the basic functionality of a system
 - Orthogonal aspects: **cross-cutting concerns**. Software modules that implement system code to be used by several other application aspects

© S. Bouchenak

Adaptive Computing Systems

12

AOP Methodology

- How do we do AOP?
 1. Decompose a system into aspects
 2. Implement the aspects
 3. Recompose the aspects to form the overall application

© S. Bouchenak

Adaptive Computing Systems

13

AOP Methodology : 1. Decompose in aspects

- Separate the software processings into :
 - Application aspects.
Example of a banking system : clients, accounts, transfers, etc.
 - Management aspects.
Examples : data persistancy, authentification, tracing, ressource sharing, performance, etc.

© S. Bouchenak

Adaptive Computing Systems

14

AOP Methodology : 2. Aspect Implementation

- Implementation of different aspects in an independent way i.e each aspect alone
- Implementation techniques
 - procedural languages (e.g. C)
 - object-oriented languages (e.g. Java)

© S. Bouchenak

Adaptive Computing Systems

15

AOP Methodology : 3. Aspects Composition (Weaving)

- Specify rules for composing aspects
- These rules are used in order to produce the final system
- Composition process: integration or weaving

- Example : before each operation on the banking system, the client must be authentified.
 - composition rule
 - application aspect
 - system aspect

© S. Bouchenak

Adaptive Computing Systems

16

How to AOP?

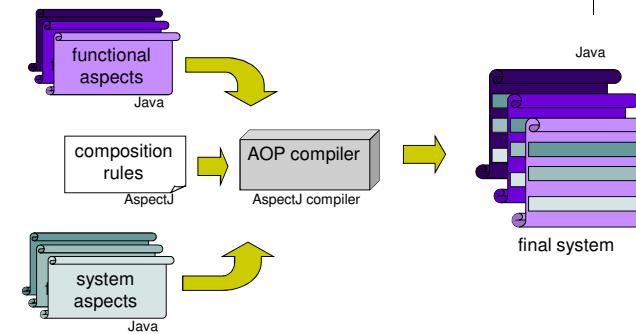

- AOP is a methodology, how do we put it into practice?
 - Aspect languages : C, C++, Java, etc.
 - Languages for specifying the rules for aspect weaving : AspectC, AspectJ, etc.
 - Aspect integration tool : aspect weaver, AOP compiler (AspectC, AspectJ, etc.)

© S. Bouchenak

Adaptive Computing Systems

17

AOP in Java

© S. Bouchenak

Adaptive Computing Systems

18

Outline

1. Introduction to AOP
2. Introduction to AspectJ
 - AspectJ Composition
 - Join point, pointcut, advice, introduction, declaration, aspect
 - Programming
 - Examples
3. Syntax of AspectJ
4. Development with AspectJ
5. Conclusion and Refs

© S. Bouchenak

Adaptive Computing Systems

19

Composition in AspectJ

- **Static composition**
 - We can change the structure of the system: classes and interfaces
 - We can add methods and attributes
 - We can declare warnings or compile-time errors
- **Dynamic composition**
 - We can add new behavior to the normal behavior of the program
 - We can extend or replace an operation
 - We can operate before or after the execution of some operations

© S. Bouchenak

Adaptive Computing Systems

20

Composition elements in AspectJ

- AspectJ
 - is an extension of Java
 - for defining rules for dynamic and static composition of aspects
- Composition in AspectJ
 - Join point
 - Pointcut
 - Advice
 - Introduction
 - Declaration (at compile-time)
 - Aspect

© S. Bouchenak

Adaptive Computing Systems

21

Join point

- Definition
 - An well-identified point in the execution of a program
 - Can be a method call or the access of an attribute
- Example

```
public class Account {  
    float balance;  
  
    void credit(float amount) {  
        this.balance += amount;  
    }  
}
```

- The Account join points include
 - the execution of the credit method
 - the access to the balance attribute

© S. Bouchenak

Adaptive Computing Systems

22

Pointcut

- Definition
 - A pointcut is used to select a given join point and access the execution context of that join point
 - Example
- `execution (void Account.credit(float))`
- Pointcut
 - select the join point corresponding to the call of the credit method of the Account class
 - get the execution context for this method: the object on which the method is called, the method's parameters

© S. Bouchenak

Adaptive Computing Systems

23

Advice

- Definition
 - The code associated to a pointcut i.e the code to be executed when the pointcut happens during the execution of a program
 - Execution before, after or in replacement of a pointcut
- Example

```
before() : execution (void Account.credit(float)) {  
    System.out.println("About to perform credit operation");  
}
```

- Advice
 - printing a message
 - before the execution of the credit method of the Account class

© S. Bouchenak

Adaptive Computing Systems

24

Introduction

- Definition
 - Static change of a class or an interface
 - Add a method or an attribute, extend inheritance relations
- Example

```
declare parents : Account implements BankingEntity;
private float Account._minimalBalance;
```

 - Introduction
 - extension of the class hierarchy
 - from now on (i.e. after weaving) Account will implement the BankingAccount interface
 - add a new attribute _minimalBalance to Account

© S. Bouchenak

Adaptive Computing Systems

25

Compile-time declaration

- Definition
 - Add instructions to be composed statically
 - Add warnings or errors messages at compilation
- Example

```
declare warning : call (void Persistence.save(Object)) :
"Deprecated method Persistence.save(),
Consider using Persistence.saveOptimized()";
```

 - Declaration
 - declare a warning
 - print a message whenever the save method of the Persistence class is called

© S. Bouchenak

Adaptive Computing Systems

26

Aspect

- Definition
 - A code module containing the rules for static and dynamic composition
 - **Introductions + declarations + pointcuts + advices = aspect**
 - An aspect in AspectJ is equivalent to a class in Java
- Example

```
public aspect ExampleAspect {
    declare parents : Account implements BankingEntity;

    before() : execution (void Account.credit(float)) {
        System.out.println("About to perform credit operation");
    }

    declare warning : call (void Persistence.save(Object)) :
        "Deprecated method Persistence.save(),
        Consider using Persistence.saveOptimized()";
}
```

© S. Bouchenak

Adaptive Computing Systems

27

Programming Methodology

- Design
 1. Identify the join points where the program behavior should be changed/extended
 2. Design the new behavior to be inserted at these join points
- Implementation
 1. Declaration of an aspect:
containing the implementation of the above design
 2. Declaration of join points
 3. Declaration of the advice:
to be associated to the above join points i.e define the new behavior to execute at these join points
 4. Add rules for static composition if necessary (introductions, declarations)

© S. Bouchenak

Adaptive Computing Systems

28

Example Hello (1 / 4)

- Application

```
public class Communicator {  
    public static void print(String message) {  
        System.out.println(message);  
    }  
    public static void print(String person, String message) {  
        System.out.println(person + ", " + message);  
    }  
}  
  
public class Test {  
    public static void main(String[] args) {  
        Communicator.print("Want to learn AspectJ?");  
        Communicator.print("Tom", "how are you?");  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

29

Example Hello (2 / 4)

- Compilation Java

```
> javac Communicator.java Test.java
```

- Execution

```
> java Test  
Want to learn AspectJ?  
Tom, how are you?
```

© S. Bouchenak

Adaptive Computing Systems

30

Example Hello (3 / 4)

- Aspect

```
public aspect HelloAspect {  
    ❶ Declaration of an aspect  
  
    pointcut printCall() : call (void Communicator.print(..)); ❷ Declaration of a pointcut  
  
    before() : printCall() {  
        System.out.print("Hello! "); ❸ Declaration of an advice  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

31

Example Hello (4 / 4)

- Compilation AspectJ

```
> ajc Communicator.java Test.java HelloAspect.java
```

- Execution

```
> java Test  
Hello! Want to learn AspectJ?  
Hello! Tom, how are you?
```

© S. Bouchenak

Adaptive Computing Systems

32

Tracing Example (1/4)

- Initial application

```
package banking;  
public class Account {  
    float balance;  
    void credit(float amount) {  
        this.balance += amount;  
    }  
    void debit(float amount) {  
        this.balance -= amount;  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

33

Tracing Example (2 / 4)

- Hand-coded modifications

```
package banking;  
public class Account {  
    float balance;  
    void credit(float amount) {  
        Logger.entering("banking.Account", "credit(float)");  
        this.balance += amount;  
        Logger.exiting("banking.Account", "credit(float)");  
    }  
    void debit(float amount) {  
        Logger.entering("banking.Account", "debit(float)");  
        this.balance -= amount;  
        Logger.exiting("banking.Account", "debit(float)");  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

34

Tracing Example (3 / 4)

- Aspect-based automatic tracing

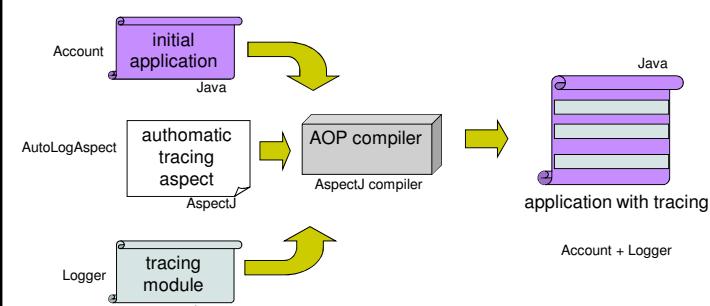

```
public aspect AutoLogAspect {  
    pointcut methodExecution() : execution (* banking.Account.*(..));  
    before() : methodExecution() {  
        Signature sig = thisJoinPointStaticPart.getSignature();  
        String className = sig.getDeclaringType().getName();  
        String methodName = sig.getName();  
        Logger.entering(className, methodName);  
    }  
    after() : methodExecution() {  
        Signature sig = thisJoinPointStaticPart.getSignature();  
        String className = sig.getDeclaringType().getName();  
        String methodName = sig.getName();  
        Logger.exiting(className, methodName);  
    }  
}
```

Adaptive Computing Systems

37

Pointcut

- pointcut syntax

[access_mode] pointcut name_pointcut([args]) : definition_pointcut

- Example

The diagram shows a horizontal line representing a pointcut declaration. The first word 'public' is labeled 'access mode'. The next word 'pointcut' is labeled 'keyword'. The identifier 'printCall()' is labeled 'pointcut name'. The colon character ':' is labeled 'pointcut type'. The method signature 'call (void Communicator.print(..)' is labeled 'signature'.

© S. Bouchenai

Adaptive Computing Systems

38

Signature of a pointcut

- Example

The diagram illustrates the structure of a pointcut declaration. It consists of several horizontal bars representing different parts of the code. The first bar is labeled "public pointcut printCall() : call (void Communicator.print(..))". Below this bar, arrows point to specific components: an arrow from the word "public" points to the label "keyword"; an arrow from the word "pointcut" points to the label "pointcut name"; an arrow from the word "printCall()" points to the label "signature"; and an arrow from the word "call" points to the label "pointcut type". Another arrow points from the word "void" to the label "access mode".

- Signature of a pointcut

- Signature of a type
 - Signature of methods/constructors
 - Signature of an attribute

© S. Bouchenak

Adaptive Computing Systems

39

Pointcut : Type Signature

Signature	Associated types
Account	Type (classe / interface) called Account
*Account	Type whose name ends with Account, e.g SavingsAccount, CheckingAccount
java.*.Date	Type Date in a direct sub-package of the package java, e.g java.util.Date, java.sql.Date
java..Date	All types Date in the java package or in a (direct or indirect) sub-package of the java package
java.util.List+	Type inheriting the java.util.List interface

© S. Bouchenai

Adaptive Computing Systems

40

Pointcut : Method Signature

Signature	Associated methods
public void Collection.clear()	public method clear() of the Collection class, method with no parameters returning void
public void Account.set*(*)	Any public method of the Account class, whose name starts with set and returning void, whatever the parameters are
* Account.*()	Any method of the class Account, no parameters, whatever the returning type and access mode are
public void Account.*(..)	All public methods of the class Account, returning void, whatever the name and the parameters are
***(..) throws RemoteException	All methods raising exception of type RemoteException

© S. Bouchenak

Adaptive Computing Systems

41

Pointcut : Constructor Signature

Signature	Associated constructors
public Account.new()	public constructor of the class Account, no parameters
public Account.new(int)	public constructor of the class Account, one int parameter
public Account.new(..)	All public constructors of the class Account, whatever the parameters are
public Account+.new(..)	All public constructors of the Account class or of one of its subclasses

© S. Bouchenak

Adaptive Computing Systems

42

Pointcut : Attribute Signature

Signature	Associated attributes
private float Account.balance	The private attribute balance of the class Account
* Account.*	All Account attributes, whatever their type, name and access mode are
public static * banking..*	All public static attributes of a class in the banking package or in one of its sub-packages
***	All attributes of all classes

© S. Bouchenak

Adaptive Computing Systems

43

Pointcut Operators

- Unary Operator : !

public !final *.*	All public and non final attributes
!Vector	All types different from Vector

- Binary Operators : && (and) || (or)

Vector Hashtable	Type Vector or Hashtable
java.util.RandomAccess && java.util.List	All type implementing both interfaces

© S. Bouchenak

Adaptive Computing Systems

44

pointcut Type

- Example

```
public pointcut printCall() : call ( void Communicator.print(..))  
    ↑  
    |  
    | keyword  
    |  
    | pointcut type  
    |  
    | pointcut name  
    |  
    |  
    | signature
```

- Type of a pointcut

- Call of a method, constructor
- Execution of a method, constructor
- Access to an attributed in read, write mode

© S. Bouchenak

Adaptive Computing Systems

45

Types of pointcuts

Pointcut Type	Syntax
method call	call(signature_method)
method execution	execution(signature_method)
constructor call	call(signature_constructor)
constructor execution	execution(signature_constructor)
class initialization	staticinitialization(signature_type)
read access to an attribute	get(signature_attribute)
write access to an attribute	set(signature_attribute)
exception handler	handler(signature_type)

© S. Bouchenak

Adaptive Computing Systems

46

Call vs. Execution (1 / 5)

- Example

```
public class Account {  
    float balance;  
  
    void credit(float amount) {  
        this.balance += amount;  
    }  
}  
  
public class Test {  
    public static void main(String[] args) {  
        Account account = new Account();  
  
        account.credit(100);  
    }  
}
```

execution

call

© S. Bouchenak

Adaptive Computing Systems

47

Call vs. Execution (2 / 5)

- Aspect using the call

```
public aspect AutoLogAspect_Call {  
    pointcut creditMethodCall() : call (* Account.credit(..));  
  
    before() : creditMethodCall() {  
        ...  
        Logger.entering(className, methodName);  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

48

Call vs. Execution (3 / 5)

- Application of AutoLogAspect_Call

```
public class Account {  
    float balance;  
  
    void credit(float amount) {  
        this.balance += amount;  
    }  
  
    public class Test {  
        public static void main(String[] args) {  
            Account account = new Account();  
            Logger.entering("Account", "credit(float)");  
            account.credit(100);  
        }  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

49

Call vs. Execution (4 / 5)

- Aspect using execution

```
public aspect AutoLogAspect_Execution {  
    pointcut creditMethodExecution() : execution (* Account.credit(..));  
  
    before() : creditMethodExecution() {  
        ...  
        Logger.entering(className, methodName);  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

50

Call vs. Execution (5 / 5)

- Application of AutoLogAspect_Execution

```
public class Account {  
    float balance;  
  
    void credit(float amount) {  
        Logger.entering("Account", "credit(float)");  
        this.balance += amount;  
    }  
  
    public class Test {  
        public static void main(String[] args) {  
            Account account = new Account();  
  
            account.credit(100);  
        }  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

51

Control Flow Pointcuts

Pointcut	Description
cflow(call (* Account.credit(..)))	All join points in the control flow of the method credit of the Account class, including the call of the method itself
cflowbelow(call (* Account.credit(..)))	All join points in the control flow of the method credit of the Account class, except the call of the method
cflow(creditMethodCall())	All join points in the control flow of the pointcut creditMethodCall
cflowbelow(execution (* Account.new(..)))	All join points in the control flow of a constructor of the class Account, except the execution of the constructor itself

© S. Bouchenak

Adaptive Computing Systems

52

cflow / cflowbelow

- Example

```
public class Test {  
    public static void main(String[] args) {  
        Account account = new Account();  
  
        account.credit(100);  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

53

cflow / cflowbelow

```
public class Account {  
    int id; // account id  
    Database database; // associated database  
  
    float getBalance() {  
  
        return database.query("SELECT balance FROM accounts WHERE id=" + id);  
    }  
  
    void setBalance(float b) {  
  
        database.update("UPDATE accounts SET balance="+b+" WHERE id=" + id);  
    }  
  
    void credit(float amount) {  
  
        setBalance(getBalance() + amount);  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

54

cflow / cflowbelow :

```
public class Database {  
    float query(String sqlQuery) {  
  
        ... reading data from the database  
    }  
  
    void update(String sqlQuery) {  
  
        ... writing data to the database  
    }  
}
```

Adaptive Computing Systems

55

cflow / cflowbelow

- Control flow

© S. Bouchenak

Adaptive Computing Systems

56

cflow

- Aspect using cflow

```
public aspect AutoLogAspect_CallF {  
    pointcut creditMethodCallF() : cflow( call (* Account.credit(..)) );  
  
    before() : creditMethodCallF() {  
        System.out.println("Hello!");  
    }  
}
```

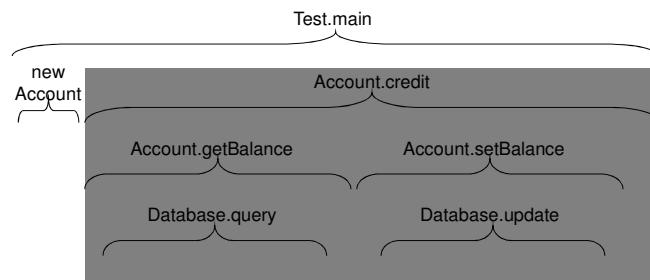

© S. Bouchenak

Adaptive Computing Systems

57

cflow

- cflow(call(* Account.credit(..)))

© S. Bouchenak

Adaptive Computing Systems

58

cflow

- Example

```
public class Test {  
    public static void main(String[] args) {  
        Account account = new Account();  
        System.out.println("Hello!");  
        account.credit(100);  
    }  
}
```

© S. Bouchenak

Adaptive Computing Systems

59

cflow

```
public class Account {  
    int id; // account id  
    Database database; // associated database  
  
    float getBalance() {  
        System.out.println("Hello!");  
        return database.query("SELECT balance FROM accounts WHERE id=" + id);  
    }  
  
    void setBalance(float b) {  
        System.out.println("Hello!");  
        database.update("UPDATE accounts SET balance='"+b+"' WHERE id=" + id);  
    }  
  
    void credit(float amount) {  
        System.out.println("Hello!");  
        setBalance(getBalance() + amount);  
    }  
}
```

An error here; what is it?

64

Pointcuts related to lexical structure

Pointcut	Description
within(Account)	All join points in the class Account
within(Account+)	All join point in the class Account and in its subclasses
withincode(* Account.credit(..))	All join points in the method credit of the class Account

© S. Bouchenak

Adaptive Computing Systems

65

Example with within

- Aspect with execution

```
public aspect AutoLogAspect_Execution {
    pointcut methodExecution() : execution (* Account.*(..))
        && within(banking..);

    before() : methodExecution() {
        ...
        Logger.entering(className, methodName);
    }
}
```

Pointcuts related to execution object

Pointcut	Description
this(Account)	Every join point where this instance is of the Account class or of one of its subclasses. This pointcut is used in combination with execution
target(Account)	Every join point where the object on which the method is called is instance of Account or of one of its subclasses. Pointcut used in combination with call

- this(Type) or this(ObjectIdentifier..)
- target(Type) or target(ObjectIdentifier..)

67

Pointcuts arguments

Pointcut	Description
args(String,...,int)	All join points of all the methods where the first argument is of type String and the last argument is of type int.

- args(Type or ObjectIdentifier..)

Advice

- Advice :
 - Code to execute at a join point
- Syntax of an advice

```
specification_advice([args]) : name_pointcut([args]) {  
    ... advice body  
}
```

Example

```
before () : printCall () {  
    ... advice body  
}  
specification of advice
```

© S. Bouchenak

Adaptive Computing Systems

69

Advice : Syntax

Syntax of an advice

```
specification_advice([args]) : definition_pointcut {  
    ... advice body  
}
```

Example

```
before () : call ( void Communicator.print(..) ) {  
    ... advice body  
}  
specification of advice
```

© S. Bouchenak

Adaptive Computing Systems

70

Types of advice

- Advice before
 - executes before join point
- Advice after
 - executes after join point
- Advice around
 - surrounds execution of join point

© S. Bouchenak

Adaptive Computing Systems

71

Advice before

Example

```
before () : call ( * Account.*(..) ) {  
    ... authentify the user  
}
```

Particular case

- If the advice raises an exception, the method is not executed

Examples

- Tracing, authentication, etc.

© S. Bouchenak

Adaptive Computing Systems

72

Advice after

- Termination (normal or exception)

```
after() : call (* Account.*(..)) {  
    ... trace all terminations  
}
```

- Normal termination

```
after() returning() : call (* Account.*(..)) {  
    ...
```

- Termination with an exception

```
after() throwing() : call (* Account.*(..)) {  
    ... trace the exception  
}
```

© S. Bouchenak

Adaptive Computing Systems

73

Advice around

- Replace a processing

```
around() : call (void Account.credit(float)) {  
    ... new implementation of the method  
}
```

- Surround a processing

```
around(Account account, float amount) :  
    call (* Account.credit(float)) && target(account) && args(amount) {  
        ... trace the beginning of the method execution  
        proceed(account, amount); // method execution  
        ... trace the end of the method execution  
    }
```

© S. Bouchenak

Adaptive Computing Systems

74

Context passing between join point and advice (1 / 3)

- Parameter passing

```
before (Account account, float amount) :  
    call (* Account.credit(float)) && target(account) && args(amount) {  
        System.out.println("Crediting from " + account + " value " + amount);  
    }
```

© S. Bouchenak

Adaptive Computing Systems

75

Context passing between join point and advice (2 / 3)

- Get the result

```
after returning (Object object) :  
    call (Object Account.*(..)) {  
        System.out.println("Result " + object);  
    }
```

© S. Bouchenak

Adaptive Computing Systems

76

Context passing between join point and advice (3 / 3)

- Get the exception

```
after throwing (RemoteException except) :  
  
    call (* Account.*(..) throws RemoteException ) {  
  
        System.out.println("Exception " + except );  
    }
```

AOP in few words

- AOP: what for?

- EXtend an existing system so as to integrate new behaviors
- Modular design of a system composed of multiple aspects (application and management)

Agenda

Lecture, Monday, 14:00 – 17:00	Lab, Monday, 14:00 – 17:00
Introduction to adaptive computing systems	Java Management eXtensions – JMX
AOP-based adaptive systems	Introduction to AspectJ
	Interruption week
Non-functional aspects of computing systems (logging, security, dependability, etc.)	
	Logging with AspectJ
Autonomic computing (case studies)	
	Security with AspectJ
Self-adaptive systems (case studies)	
	Dependability with AspectJ
	Interruption week
Summary and future directions	Evaluation
